Title Magneettisia mittauksia — Magnetic Results	
Abstract The magnetic yearbook of the magnetic recordings at the Nurmijärvi observatory contains tables, figures of hourly, monthly, and yearly means of the magnetic field components X, Y and Z as well as magnetic activity indices (K, Ak) in 2010. Magnetic isolines describing the distribution of geomagnetic field components in Finland 2011.0 are shown by a series of maps.

1 Introduction

This report presents magnetic measurements carried out at the Nurmijärvi (NUR) Geophysical Observatory between January 1 and December 31, 2010. The observatory is operated by the Finnish Meteorological Institute (FMI) and is part of the Observation Services Division of the institute. Information about the IMAGE magnetometer network is included in this report, as it is partly operated by the observatory. The Nurmijärvi Geophysical Observatory started recording the Earth's magnetic field in April 1952. The first yearbook was for 1953.

2 Description of the observatory

The observatory is located some 40 km NNW from Helsinki in the northern part of the Nurmijärvi municipality having about 40,000 inhabitants. The observatory lies on a moraine ridge by the lake Sääksjärvi. The 7 ha forest area of the observatory is limited to the lake in the North and North-East, to a nature reserve forest in the South and to a private forest in the West. There are no artificial disturbance sources nearby.

The coordinates of the observatory are:

	Lat.	Lon.
Geographical	60°30.5'N	24°39.3'E
Geomagnetic	57°43.8'	113°28.8'
Corr.geomagnetic	56°49.2'	102°31.2'

The magnetic coordinates are referred to the IGRF-95 model:

L-value	3.3
Height	105m

The Nurmijärvi observatory is running two magnetometers, which are controlled usually once per week with absolute measurements. Another magnetic recording system at the observatory is the three-component pulsation magnetometer of the Sodankylä Geophysical Observatory. The Air Quality Department of FMI makes continuous airborne radioactivity recording. An automatic weather station observes the following: temperature, humidity, snow depth, current weather, rain and clouds. University of Leicester operates the radio transmitter for ionospheric research. The receiver is in United Kingdom. Nurmijärvi municipality needs the water level observations in the lake Sääksjärvi. The seismic station of the Helsinki University has ceased its operation at the observatory and only some temporary measurements are performed.

The Nurmijärvi observatory has a magnetic calibration and test laboratory for magnetometer and sight compass calibrations and for compass swing base measurements at airfields. FINAS (Finnish Accreditation Services) accredited the laboratory as the number K050 on 17th of August 2007.

3 Recording instruments

In the variation house the Danish suspended flux gate magnetometer (FGE-89) is the primary instrument. The Ukrainian LEMI-004 flux gate magnetometer is the second variometer. The sensors are directed in geographic North and East directions

measuring the X, Y and Z components. The temperature in the variometer room is kept at 18°C. Analog voltages from the magnetometers are AD-converted in the variation room and the digital data are transferred through optical wires to the computers in the main observatory building. The Linux based software stores the data in three files as one-second, ten-seconds and one-minute averages. Timing is based on GPS time sheared through the local network. The standard one-minute values are averages over one minute periods starting and ending at a half minute (e.g. 59:30 - 00:30, 00:30 - 01:30, 01:30 - 02:30). The given time is the starting minute at the centre of the period (00, 01, 02 etc.).

In the Autumn 2010 a Russian POS-1 proton magnetometer was installed in an old empty coil hut. The data is transferred through optical wires to the same data acquisition computer that stores the FGE-89 data. Absolute value is taken once in every 10 seconds.

4 Absolute measurements

The total field (F) was measured by a Polish PMP-7 proton precession magnetometer and declination and inclination with a DI-flux-magnetometer, which consists of a non-magnetic Zeiss-Jena theodolite (010B) and of a flux-gate element mounted on its telescope. The absolute measurements were done on average once a week. The base line values as determined for the FGE are shown in Fig. 3.

5 Data processing and dissemination

In the processing the final base line values and sensitivities were used and hourly mean values were calculated. The measured base line values were followed closer than half a nanoTesla. All the digital data were visually inspected on the computer screen.

Tables showing the three-hour K-indices were computed from 10 s data using the 'FMI' algorithm. The upper limit for $K=9$ is $750nT$.

Daily magnetograms and K-indices were published in the monthly bulletin together with the Sodankylä Geophysical Observatory of the University of Oulu. The bulletin contains daily magnetograms of Nurmijärvi, Hankasalmi, Oulujärvi and Sodankylä, daily ionosond and riometer recordings and cosmic ray data.

Daily files of minute data were sent by e-mail for the INTERMAGNET system. INTERMAGNET DVD 2008 will be published in 2011 containing minute data, annual means and base line values from Nurmijärvi together with over a hundred of other magnetic observatories.

6 IMAGE and repeat stations

The IMAGE magnetometer network (Fig. 2) consisted at the end of 2010 of 32 stations from Tartu in Estonia to Ny Ålesund on Svalbard. The new principal investigator of this international project was Eija Tanskanen at FMI. The observatory operated nine IMAGE stations in Finland (including Nurmijärvi), one in Estonia and one in northern Norway. At seven of the stations the service and absolute measurements were done in co-operation with the Sodankylä Geophysical Observatory of the Oulu University.

2009.5	12824	2400	51173	
2010.5	12810	2431	51229	

Table 2: Annual mean values (all days) at the Oulujärvi IMAGE station.

The data sampling intervals at the IMAGE stations were 1, 10 and 60 seconds. The IMAGE standard used the 10s values and they were averages over the seconds 00-10, 10-20, 20-30 etc. The time stamp given for the 10-second period was the first second of that period.

Most of the stations had ADSL or direct network connections and only OUJ was still operated through a GPRS modem. Data transmission from the stations was moved from the observatory to the Helsinki office of FMI. The data of the eleven stations were processed and inspected and were sent for IMAGE filing.

6.1 Pello IMAGE station

Pello ($66^{\circ}54.2'N$, $24^{\circ}04.7'E$) close to the border with Sweden in Lapland has a tilt suspended FGE magnetometer and absolute measurements are made once or twice a year. The annual mean values for all days were calculted and are listed in table 1.

6.2 Oulujärvi

At Oulujärvi ($64^{\circ}31'N$, $27^{\circ}14'E$) absolute measurements were made in the new absolute house. Annual mean values are available since 1993. In the table 2 are the annual mean values for the last 10 years, calculated for the old absolute house until 2006 and for the new absolute house since 2007.

Year	X[nT]	Y[nT]	Z[nT]
2006,5	13839	1988	50116
2007,5	13843	2020	50149
2008,5	13839	2056	50182
2009,5	13831	2093	50213
2010,5	13815	2140	50250

Table 3: Annual mean values (all days) at the Hankasalmi IMAGE station.

Year	D[°]	H[nT]	Z[nT]
2000,5	7,531	14578	49574
2002,5	7,763	14583	49655
2004,5	8,001	14580	49740
2005,5	8,118	14580	49778
2006,5	8,224	14583	49805
2007,5	8,357	14587	49839
2008,5	8,491	14596	49871
2009,5	8,624	14593	49900
2010,5	8,787	14571	49944

Table 4: Reduced results from the Virolahti repeat station.

6.3 Hankasalmi

Hankasalmi in central Finland is one of the IMAGE stations. The station was first established in 1992 at the Sauvamäki village ($62^{\circ}18.3'N$, $26^{\circ}39.0'E$) but was relocated in 2005 at a new site ($62^{\circ}15.2'N$, $26^{\circ}35.8'E$) at the Murtoinen village. A concrete basement for absolute measurements was made nearby the recording magnetometer and absolute measurement have been performed every Summer since 2005. The table 3 shows the annual mean values for all days at Hankasalmi.

6.4 Virolahti repeat station

Virolahti ($60^{\circ}33.7'N$, $27^{\circ}33.4'E$) in the South-East Finland is one of the old repeat stations in Finland started in 1947. The station was visited in 2010 and four measurements during one day were made. The table 4 shows results of the last 10 years. The annual mean value of quiet days at the Numijärvi observatory was used to reduce the measurements at Virolahti.

6.5 SAMNET stations

The observatory provided 1-second data from the stations KIL, OUJ, HAN and NUR for the SAMNET magnetometer network operated by the Lancaster University in United Kingdom.

7 IMAGE Magnetometer Network

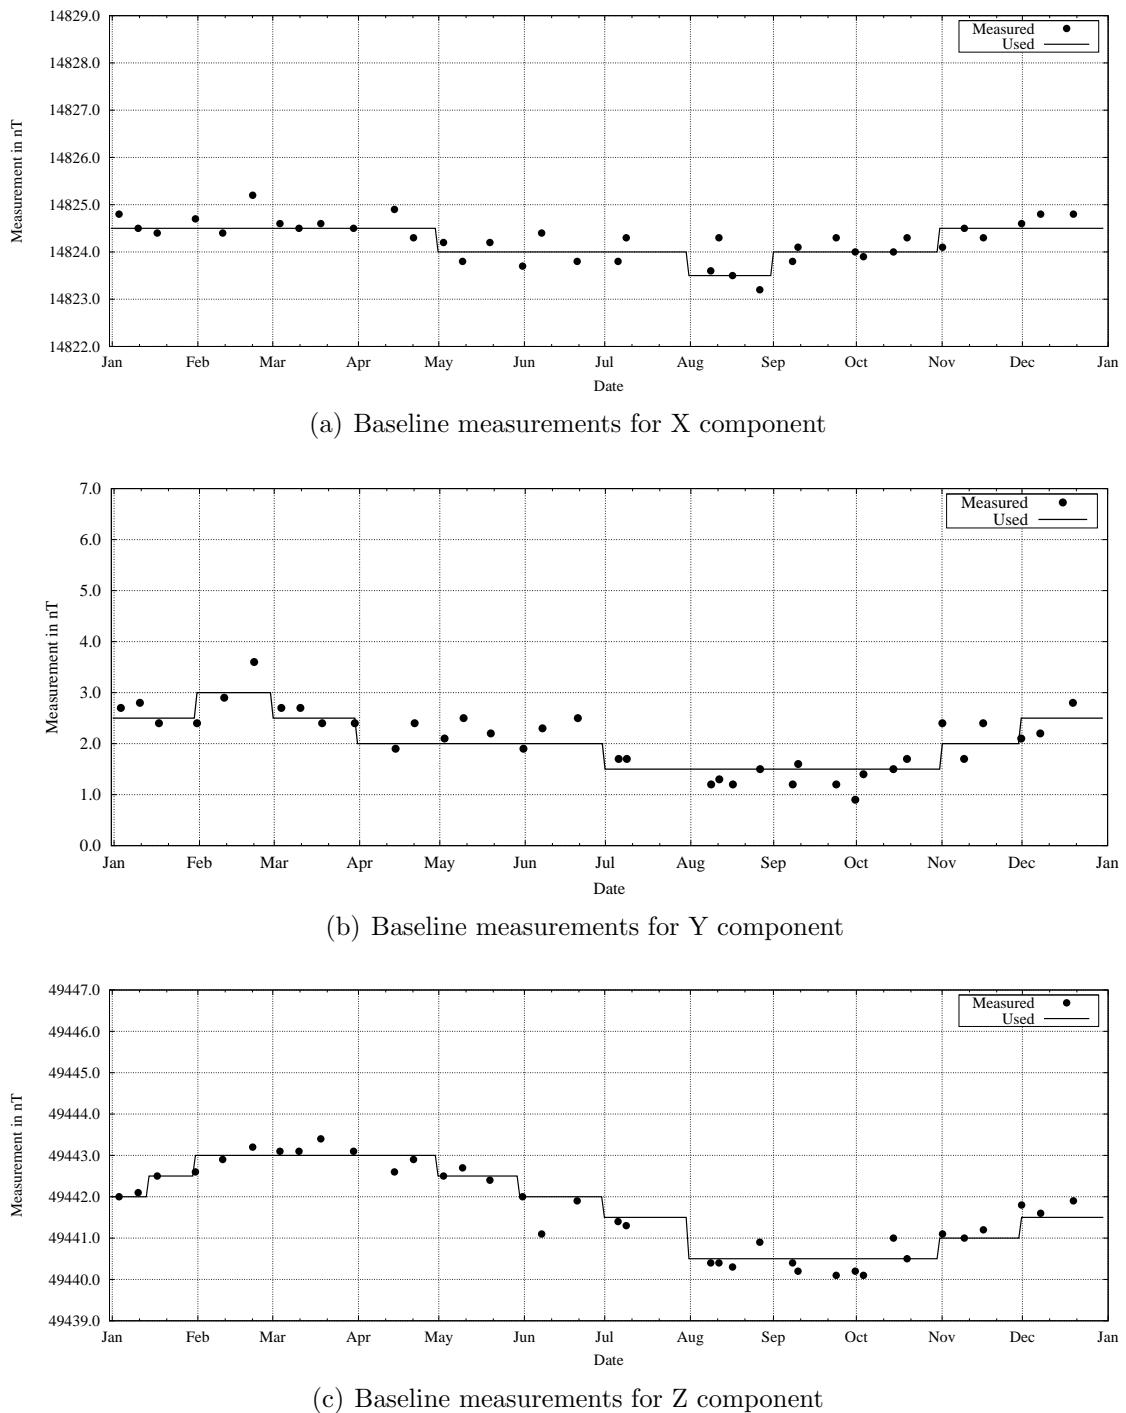

Figure 3: Baseline measurements

9 Tables of Hourly Means of X, Y, and Z

Explanations of the tables:

- **X** is the North component of the magnetic vector
- **Y** is the East component of the magnetic vector
- **Z** is the vertical component of the magnetic vector
- The unit is nanotesla (nT) = 10^{-9} T
- The time is universal time (UTC). The local time is UTC + 2 h (during the daylight saving time UTC + 3 h)

Nurmijarvi Finland

17 Earth's Magnetic Field Maps of Finland 2011.0

The isolines of total field (F) and horizontal field (H) are given in nanoteslas (nT), declination (D, positive eastwards) and inclination (I, positive downwards) in degrees of arc.

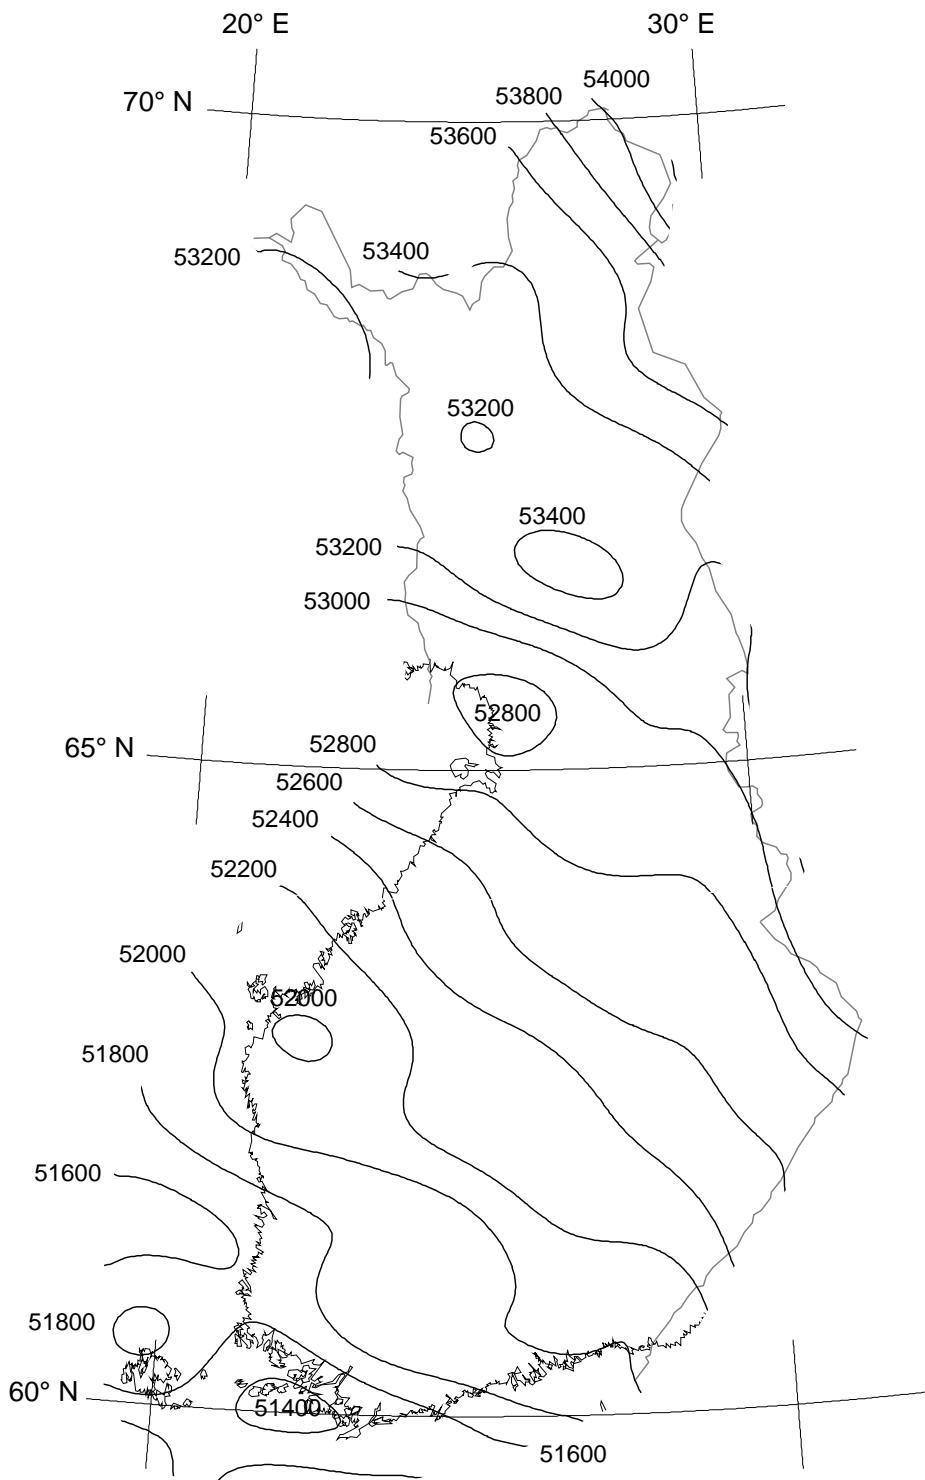

TOTAL INTENSITY (F) 2011.0

Figure 14: Total intensity F 2011.0 in nT

HORIZONTAL INTENSITY (H) 2011.0

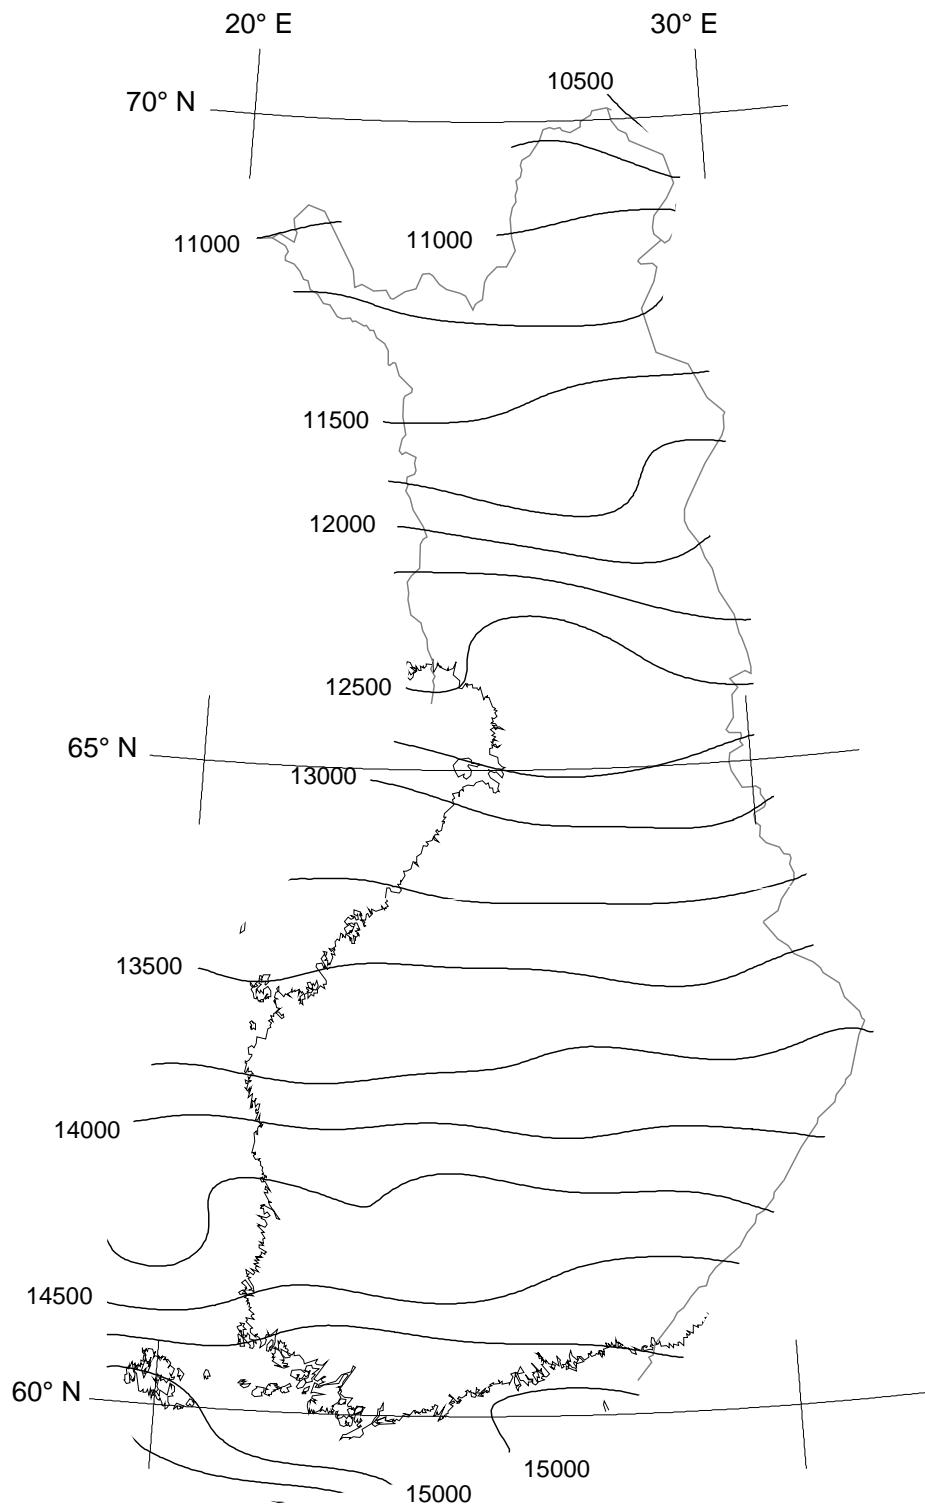

Figure 15: Horizontal intensity H 2011.0 in nT

DECLINATION (D) 2011.0

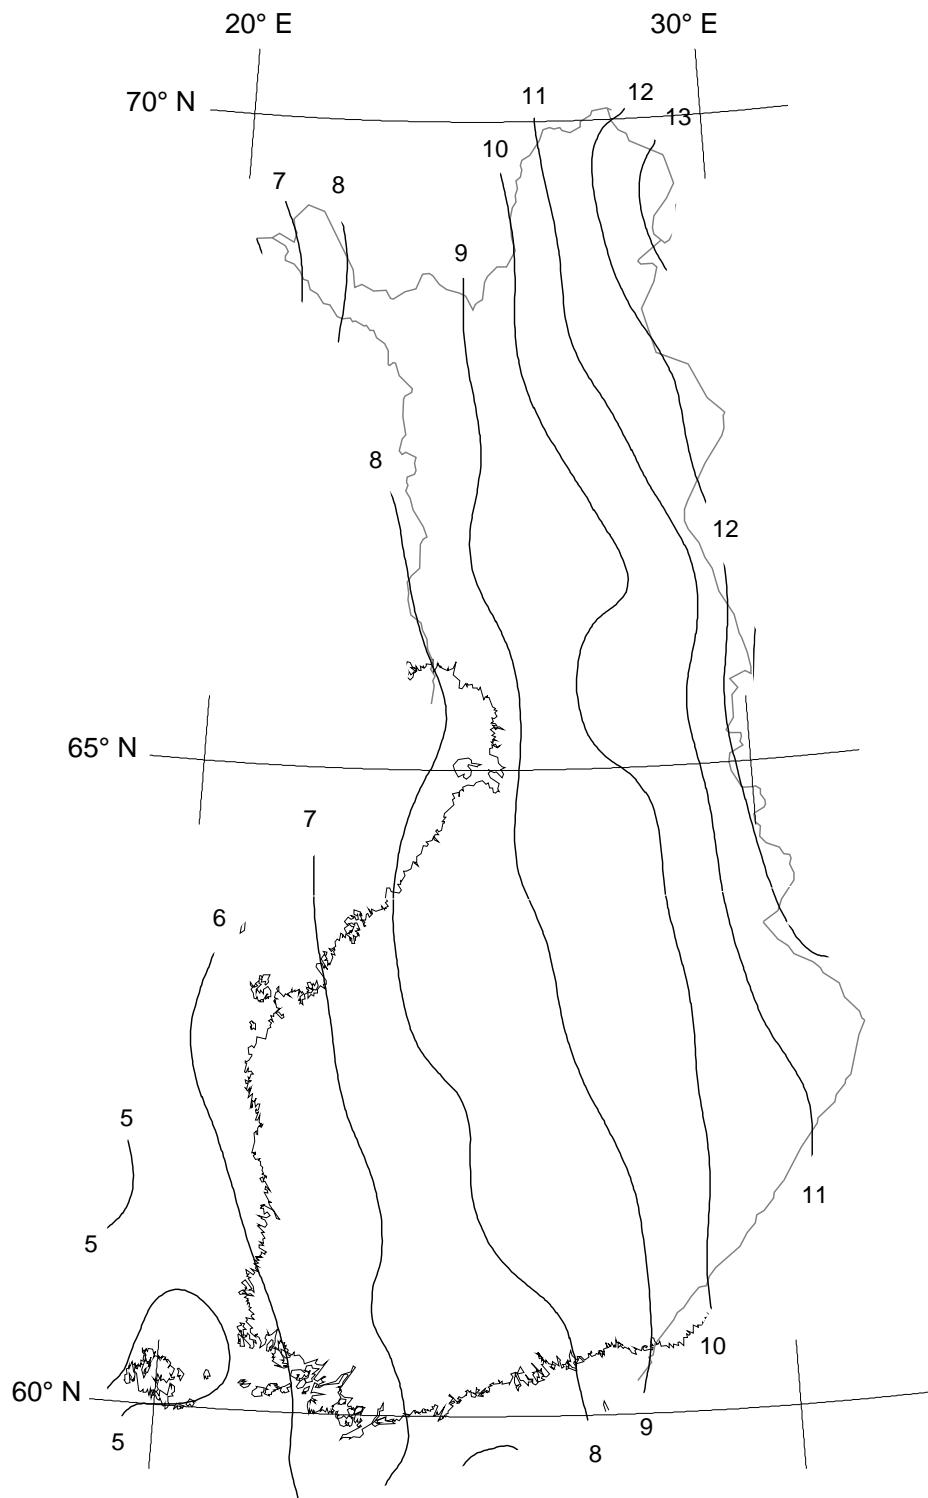

Figure 16: Declination D 2011.0 in degrees

INCLINATION (I) 2011.0

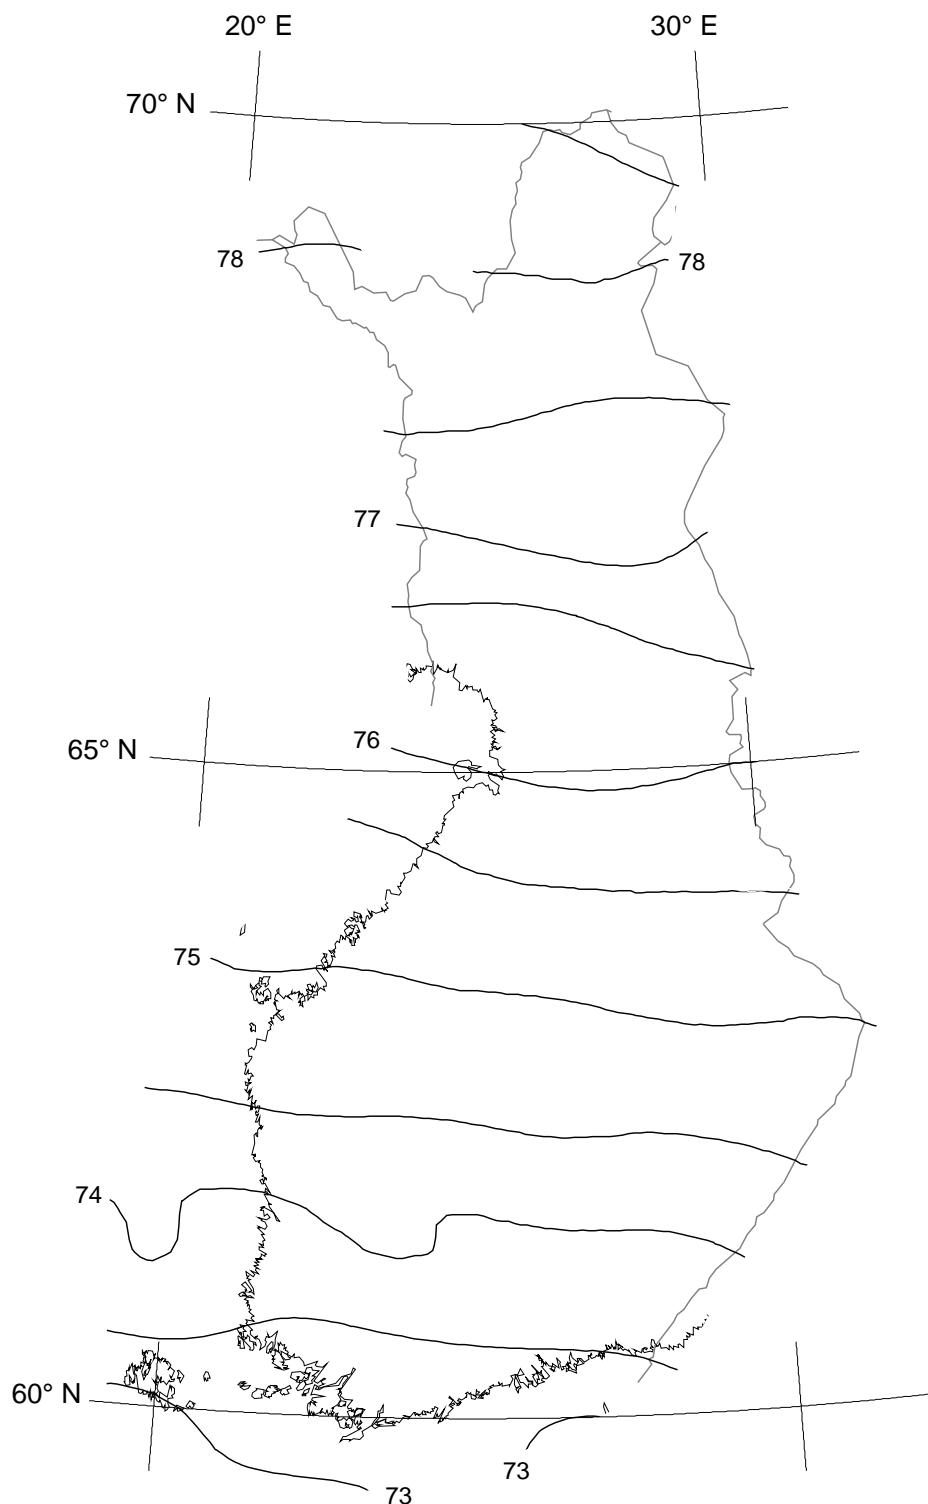

Figure 17: Inclination I 2011.0 in degrees
